Pfizer CentreOne

A culture of confidentiality

We aim to provide peace of mind as you prepare to bring your pharmaceutical product to market as a CMO dedicated to protecting your Intellectual Property (IP) with a comprehensive CARE system in place.

C **Controlled:** Your confidential information is controlled and stored in an isolated space.

A **Agreements:** We follow the parameters defined in our agreements with customers.

R **Rules:** Our company policies and corporate guidance documents outline strict rules governing confidentiality.

E **Education:** Our colleagues receive continuous training on the latest best practices for handling sensitive information when working with your IP.

Protecting your IP

We place strict controls on who can access your data, operating on a "need-to-know" principle. This helps limit access to your information to only those employees and contractors whose job functions directly require it.

- ***Strong encryption:*** Your sensitive data is encrypted to help keep it unreadable without proper authorization.
- ***Advanced firewalls:*** We deploy high-grade firewalls to block unauthorized access and protect your network perimeter.
- ***Intrusion detection systems:*** Our advanced systems actively monitor for and alert on suspicious activity, providing real-time threat detection.

At Pfizer CentreOne we aim to protect your IP according to the terms of our agreement and our Pfizer policies and procedures.

Protection across the manufacturing floor

At every stage of the manufacturing journey, we take measures aimed at securing your IP by putting processes in place:

Processes to protect from crossover

We aim to provide separation between your processes and ours, leveraging a combination of physical safeguards, advanced technology and well-defined protocols to help protect your sensitive information.

We conceal your project identity

By assigning a unique project code to your project, we conceal the nature of your project and use this code across your batch records to manufacture your product effectively.

Operators never see the full process

Each manufacturing floor operator only handles one or two of the manufacturing steps involved in your product, ensuring nobody has access to the full process but you.

Securing your sensitive data

Our security measures help to keep your sensitive data safe and protected.

Physical security
Physical documents and materials that contain sensitive information are secured with restricted access.

Digital security
Our cybersecurity measures include encryption, access controls, firewalls, and intrusion detection systems to help protect your digital operations.

Network monitoring
We monitor the network for any unusual or suspicious activities that may indicate a breach and are ready to take action to help mitigate potential damage.

Powered by Pfizer's experts and resources, we're ready to help you on your journey to market with peace of mind.
